# Remote sensing / satellite observations / data in support for socio-economical studies

L. Sogacheva, A.-M. Sundström, I. Ialongo,  
Timo H. Virtanen, A. Arola, J. Tamminen

*Finnish Meteorological Institute*

19.02.22

# Satellites monitoring the environment

- Satellites provide global observations of multiple climate and environmental relevant parameters of the atmosphere, land and ocean.
- One of the major advantages is that satellites provide observations over areas where there are no ground observations or measurement network is sparse.
- Satellite measurements also facilitates the creation of long time series.

# Satellite instruments used for environmental monitoring

- Satellite instruments that monitor northern / Arctic areas are on a polar orbit.
  - at high latitudes coverage is better than at mid- or low latitudes.
- Satellite measurements are indirect: instruments measure radiation, that is con relevant environmental parameters.
- Most of atmospheric measurements are based on reflected solar radiation.
  - no observations during winter, clouds and snow can also limit observations
  - For snow and land ice monitoring also longer wavelengths are used that don't have similar limitations.

The lack of arctic observations is acknowledged in the remote sensing community

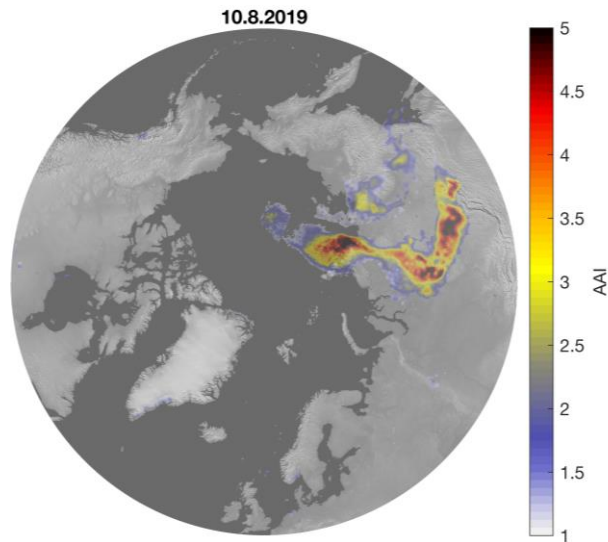

## Plans for new missions

The European Organization for the Exploitation of Meteorological Satellites (EUMETSAT) and the European Space Agency (ESA) are considering the prospects for observations from satellites in a highly elliptical orbit (HEO). This is a new opportunity that could bring weather imaging capabilities to the Arctic and high latitudes of similar quality to what is currently available in the tropics and mid-latitudes from geostationary satellites.

# Satellites monitoring the environment: FMI Activities

## Atmospheric monitoring

- Air quality, aerosols, and atmospheric composition
- Emissions from forest fires and anthropogenic sources
- Greenhouse gases

Absorbing Aerosol Index (smoke from fires)

## Land monitoring

- Snow cover; extent, snow mass
- Freezing / thawing
- Land use changes, burnt area

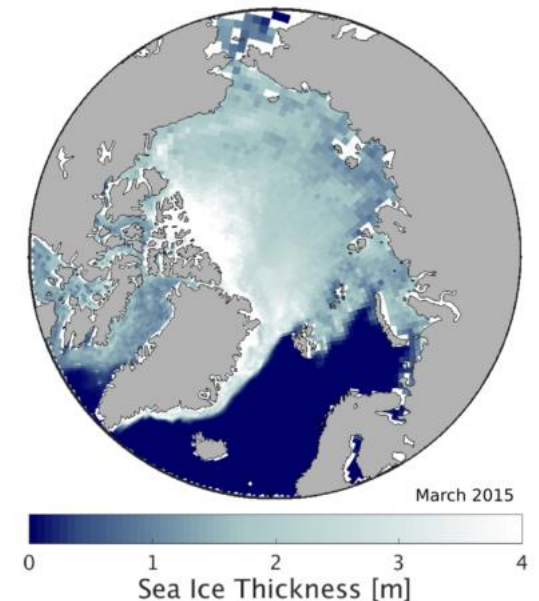

Mean snow mass in March

Pulliainen et al., Nature 2020

## Marine monitoring

- Sea ice extent and thickness

<http://esa-data-cci.org/>

# The SAMPO service

sampo.fmi.fi

## Satellite Measurements from Polar Orbit

- Web-based service that provides direct readout data of the Northern Hemisphere from OMI and OMPS instruments.
  - Receiving stations are located at Sodankylä, Finland (OMI, OMPS), and Fairbanks, Alaska, US (OMPS).
- Observations on total ozone, absorbing aerosols (smoke, dust), clouds, SO<sub>2</sub> and UV-radiation are published about 15 min. after the satellite overpass.
- SAMPO allows e.g. near real time monitoring of smoke transport in the Arctic / Northern hemisphere

# Satellite-based NO<sub>2</sub> monitoring from energy and extractive sectors in Sakha Republic, Russia

I. Ialongo, H. Virta, FMI – D. Gritsenko, Aleksanteri Institute  
 N. Stepanova, Arctic Scientific Center of Sakha Academy of Sciences, Yakutsk Russia

- Case study: Aykhal diamond mines
- NO<sub>2</sub> enhancement over the Jubileiny mine
- About 30% increase from 2018 to 2019

# Satellite-based NO<sub>2</sub> monitoring from energy and extractive sectors in Sakha Republic, Russia

I. Ialongo, H. Virta, FMI – D. Gritsenko, Aleksanteri Institute

N. Stepanova, Arctic Scientific Center of Sakha Academy of Sciences, Yakutsk Russia

- The average district-level TROPOMI NO<sub>2</sub> concentration values increase together with population and heat production
- Power generation in the Mirnysky district do not correspond to particularly high NO<sub>2</sub> levels, probably because the energy system in the district is largely based on hydropower, oil and gas extraction.

# **MethEO – Methane emissions in the Northern Hemisphere by applying both data from Earth Observing (EO) satellites and global atmospheric methane inversion model estimates**

<https://eo4society.esa.int/projects/mettheo/>

- In this project
  - Northern Hemisphere methane (CH<sub>4</sub>) sources and their connection to the soil freezing and thawing at high latitudes will be investigated .
  - methods for monitoring of CH<sub>4</sub> (methane) emissions in the Northern Hemisphere by applying both data from Earth Observing (EO) satellites and global atmospheric methane inversion model estimates will be innovatively combined .

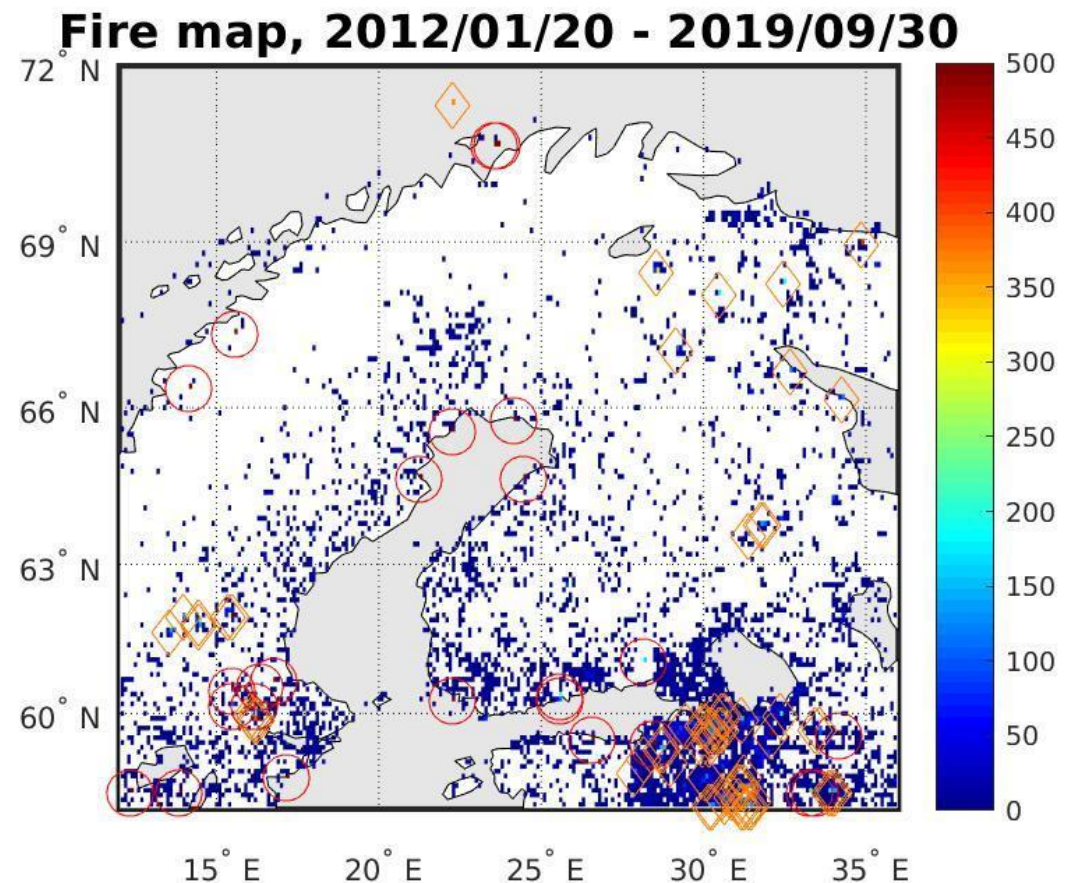

# Forest fires in Fennoscandia under changing climate and forest cover

<https://en.ilmatieteenlaitos.fi/iba-forest-fires>

## This IBA-ForestFires project

- synthesizes the current knowledge of the occurrence, monitoring, modeling and extinction of forest fires in Fennoscandia and surrounding regions.
- project investigates how forest fires can promote black carbon emissions over Arctic.
- The results will help Arctic societies to prepare for the negative impacts of climate change and support the development of efficient mitigation strategies.

Timo H. Virtanen, FMI

# Satellite data for studying contribution of fires, PEEX

<https://www.atm.helsinki.fi/peex/index.php/projects>

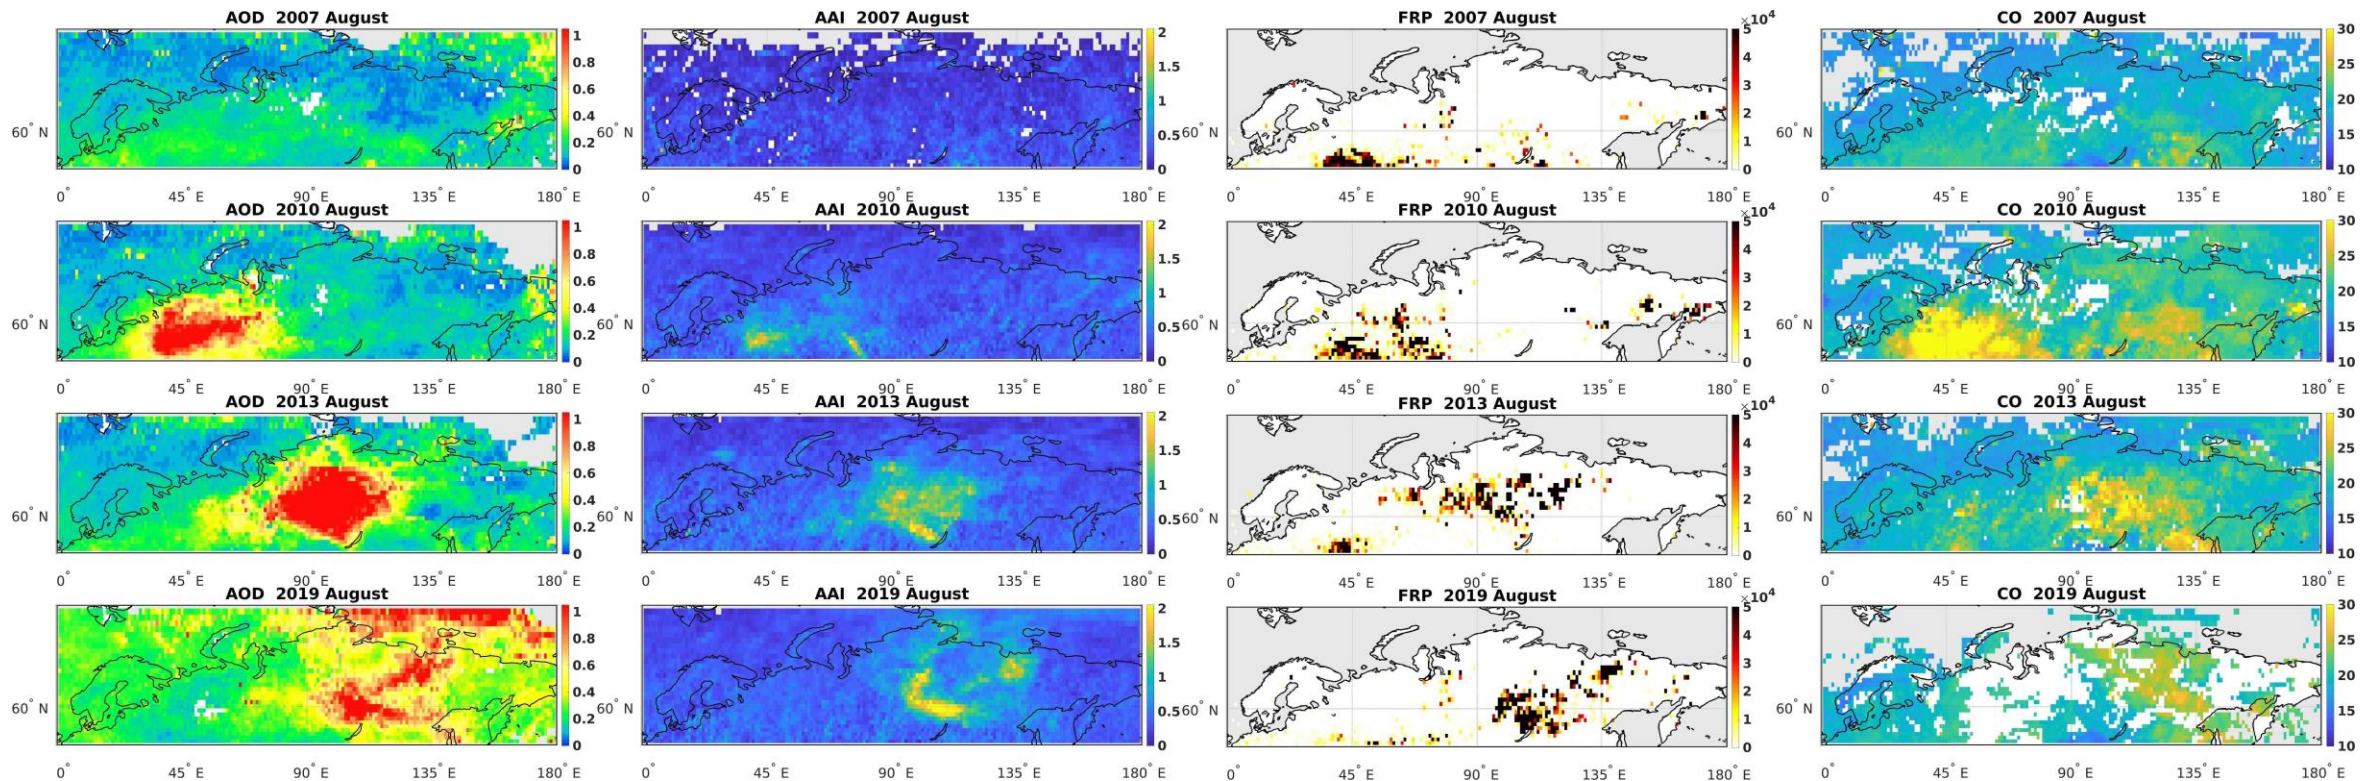

- **AOD** – MODIS, Terra
- **AAI** – multi-satellite product
- **CO** – MOPPIT, Terra
- **FC** – MODIS
- **FRP** - MODIS
- **NO2** – OMI, TROPOMI
- **HCHO** – OMI, TROPOMI
- **SO2** – OMI, TROPOMI

To support satellite-based studies, data from ERA5 model are utilized

- **Temperature**
- **Precipitation**
- **Evaporation**

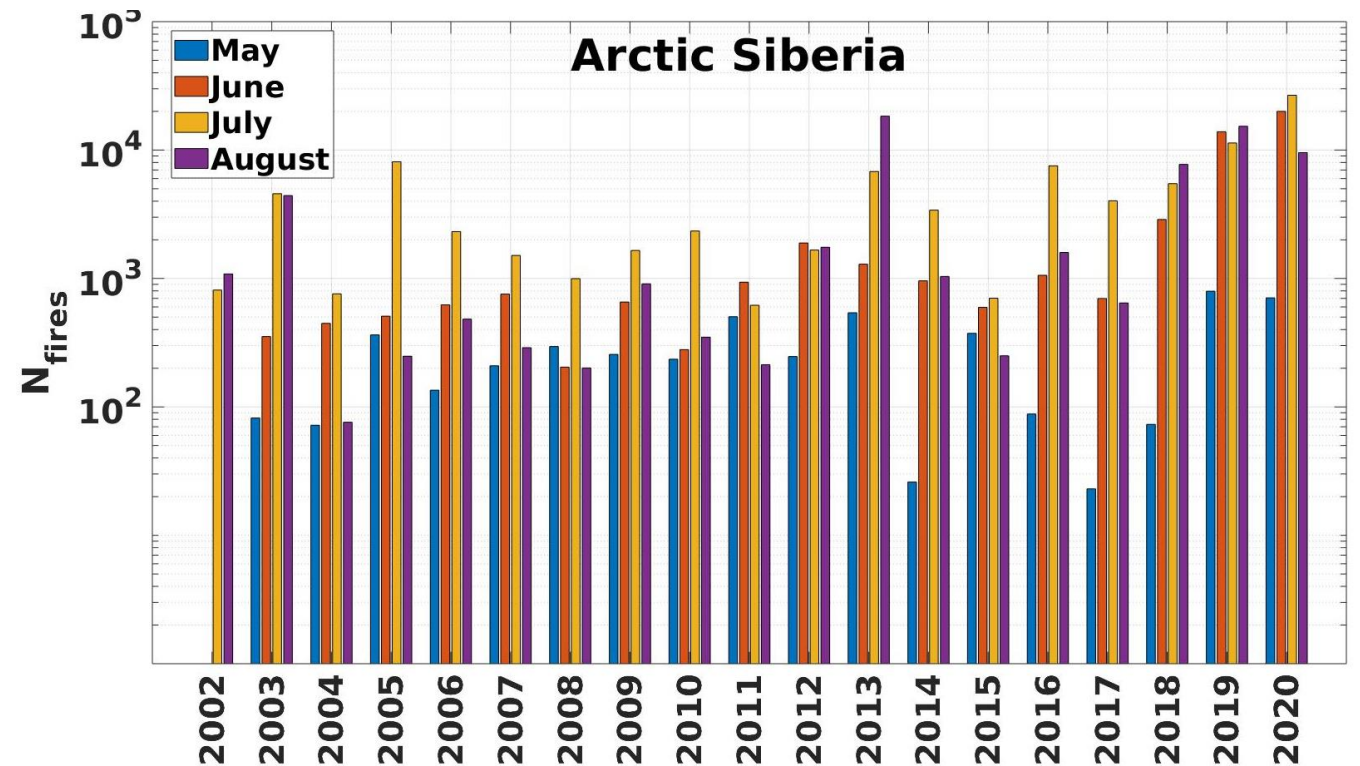

# Satellite data for studying contribution of fires, Arctic area (1)

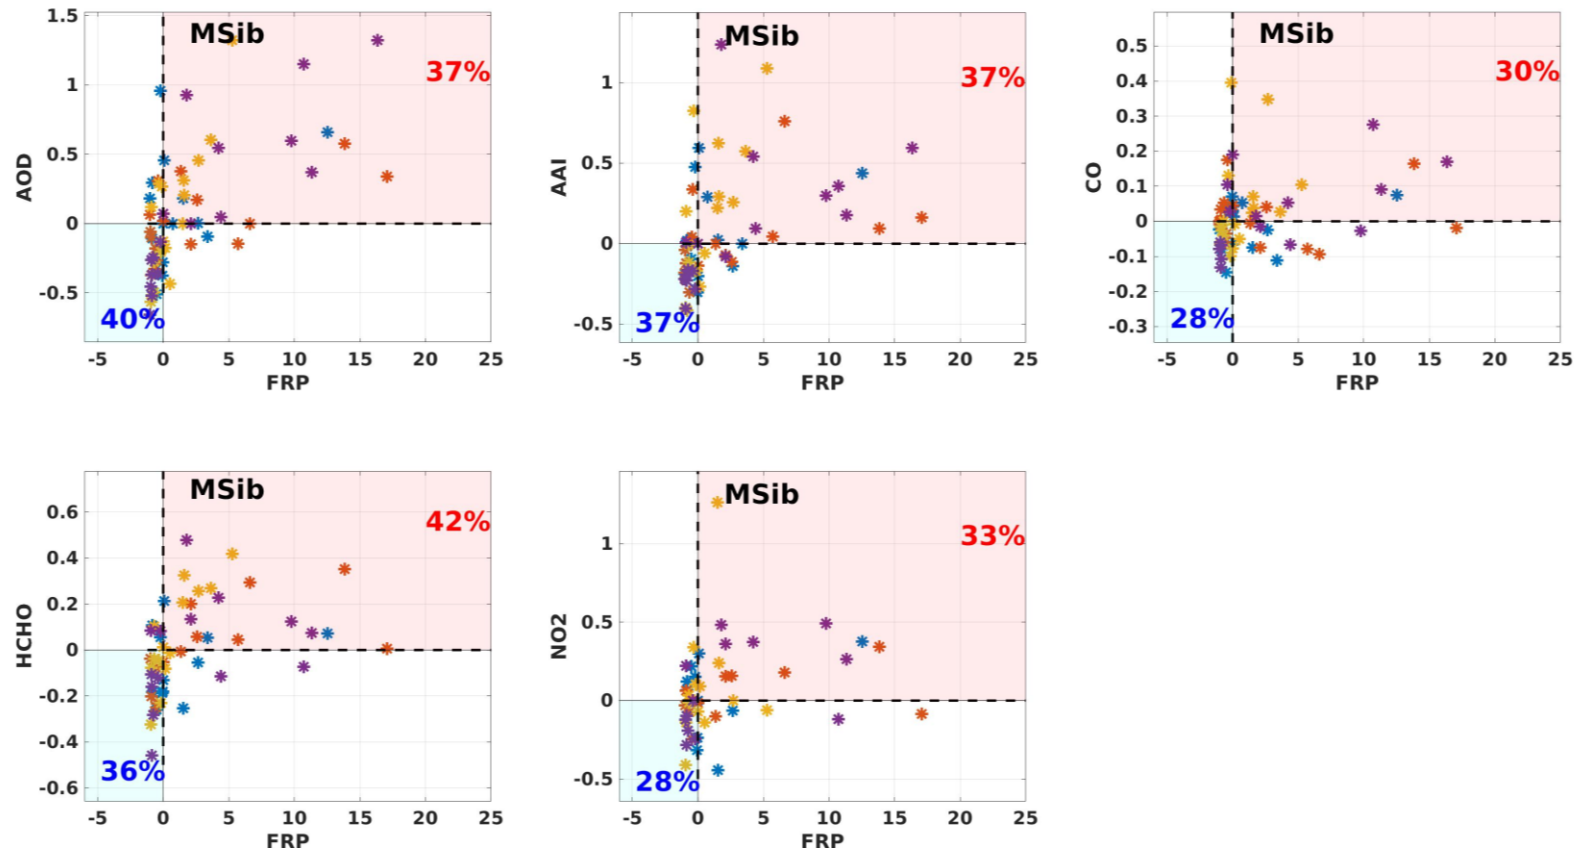

# Satellite data for studying contribution of fires, Arctic area (2)

- FRP and N of fires, time series

# Satellite data for studying contribution of fires, Arctic area (2)

- FRP and AOD/AAI/CO/HCHO/NO2 anomalies

# Conclusions

- Special attention has to be put to the environmental changes happening in Arctic due to the temperature rise
- Satellites provide lots of data which allow following those changes
- We should think how to better utilize data available, in combination with ground-based and modelled data
